

CASE STUDY — FINTECH

Reconciliation that closes in *hours, not days.*

Ledgerline Capital's finance team was closing the books on manual spreadsheet reconciliation. We took an internal proof-of-concept to a production system their controllers trust unattended.

Three stages, one close-day outcome.

Most firms deliver a technical build. We own the outcome — design and engineering working together so the reconciliation engine actually runs the monthly close.

The Workshop surfaced a narrow, well-understood problem: three source ledgers, one manual spreadsheet, and a controller re-keying totals every month-end. Labs validated a rules-plus-ML matching engine against eighteen months of historical statements before Studio took it into production.

Every unmatched line now has a reason attached to it. The controllers stopped re-checking the engine's work within the first close cycle.

WORKSHOPS

LABS

STUDIO

The engagement model

STAGE	WHAT IT IS	LENGTH
Workshops	Ledger mapping, reconciliation-rule discovery, roadmap	2 weeks
Labs	Matching-engine prototype, validated on historical statements	10 weeks
Studio	Production build, controller console, monthly close handoff	Ongoing

What shipped

- A matching engine reconciling three ledgers nightly, with a confidence score per line.
- A controller console surfacing only the unmatched exceptions, not the full ledger.
- An audit trail that satisfies the quarterly external review without a manual export.

LEDGER-MATCHING FLOW, THREE SOURCES INTO ONE CLOSE

6x

OUTCOME

faster month-end close, from four business days to under six hours, after the first full close cycle on the new engine.
